

Notification of classification and labelling

Manufacturers and importers of chemical substances must notify the classification and labelling of substances to ECHA in compliance with the CLP regulation. The information will be available in a new, publicly accessible database named "Classification and Labelling Inventory".

Pure substances and substances in mixtures

Classification and labelling for all manufactured or imported substances must be notified. Moreover, classification of substances in imported mixtures must be notified if the substance concentration exceeds a certain limit.

The notification to the Classification and Labelling Inventory includes all substances which must be registered according to REACH. For substances that are not to be registered under REACH only notification for classified substances is required.

No lower amount limit

The classification and labelling of substances must be notified regardless of the amount produced or imported. This includes both substances registered under REACH and non-registered substances.

Deadline

Notification must be given by 3 January 2011 for substances already on the market on 1 December 2010. If a substance is already registered under REACH prior to 3 January 2011, and the registration comprises a CLP classification, no further notification is required.

DHI offers

- Classification and labelling in compliance with CLP, based on substance data
- Assistance with data searches, including classification and labelling
- Notification of classification and labelling to ECHA
- Consultancy on notification requirements
